(54) Title: ORGANIC COMPOUNDS

(57) Abstract: Compounds of general formula (I) wherein the substituents are as defined in claim 1 are suitable for use as herbicides.

### Organic Compounds

The present invention relates to novel herbicidally active organic compounds (substituted 3-phenoxy-1-phenyl acetylene derivatives), to their preparation, to compositions comprising said compounds, and to the use thereof for controlling weeds, in particular in crops of cultivated plants or for inhibiting plant growth.

Herbicidally active 4-(alkoxycarbonylamino)-phenol derivatives are disclosed, for example, in Derwent 1999-379868/32 (JP-A 11147866).

Novel substituted 3-phenoxy-1-phenyl acetylene derivatives having herbicidal and growth-inhibiting properties have now been found.

Accordingly, the invention relates to compounds of the general formula I

### **General Methods**

Scheme 1

The preparation of the compounds 1b can be obtained by the following methods: Method A) Substituted phenols can be alkylated by the treatment with a base and propargylic derivatives, 2 under the conditions used for etherification of phenols, step 1. The propargylic ether is then coupled with an activated benzene using typical conditions for the Sonogashira reaction (K. Sonogashira, *Comprehensive Organic Synthesis*, vol 3, p-521, 1991) exemplified by the use of tetrakis triphenylphosphine palladium (II) and copper (I) iodide as the catalyst mixture. Activation of the benzene 3 usually requires that A is a leaving group such as iodide, bromide, tin group, borate group (J. Tsuji, *Palladium Reagents and Catalysts - Innovations in Organic Synthesis*, Chichester 1995), a trifluoromethanesulfonate (i.e. triflate, K. Ritter, *Synthesis* 735, 1993) or a hypervalent iodonium salt (R.M. Moriarty, *Synthesis* 431, 1990). There are special cases in which highly activated transition metals will also couple benzenes containing a chloride group (S.L. Buchwald, *Angew. Chem. Int. Ed.*, 38, 2413, 1999). In cases where R is a suitable phenol protecting group (e.g. trimethylsilyl ether, methoxymethyl ether etc., T.W. Green, *Protecting Groups in Organic Synthesis*, John Wiley & Sons 1981), this group can be optionally removed by appropriate means and the subsequently deprotected hydroxyl group can be manipulated by methods described previously for Scheme 1, step 1.

## Scheme 2

Method B) Reaction of a phenol with orthoformate esters followed by reduction, Scheme 2 step 1. This is equivalent to formation of the hemiketal, 2 reacting a phenol with a ketone (or aldehyde) or transketalization with an appropriate ketal partner (F.J.J. Meskens Synthesis 501, 1981). Treatment of this hemiacetal with halogenating or sulfonating reagents give the reactive hemichloro ether, 3a or hemisulfonate ether 3b respectively which can be directly displaced with acetylenes under strong basic conditions (e.g. lithium diisopropylamide, potassium hydride etc.).

## Scheme 3

Method C) Coupling of the appropriately substituted benzenes ( $\text{R}_{100}$  being for example  $\text{C}_1$ , alkyl or phenyl) with propargylic alcohols or generally terminal acetylenes, Scheme 3, step 1 via palladium and copper catalysis is commonly known as the Sonogashira reaction (K. Sonogashira, *Comprehensive Organic Synthesis*, vol. 3, p-521, 1991). The alcohol group can be activated by conversion to a leaving group (LG) such as an acetate, chloride, bromide, or a sulfonate ester which then facilitates subsequent displacement with substituted phenols, Scheme 3 step 3 (I.S. Mann, *Synthesis* 707, 1995).

## Scheme 4

Method D) Phenyl acetylenic esters, 2 (R<sub>100</sub> being for example C<sub>1-4</sub>alkyl or phenyl) can be prepared by the Sonogashira coupling of propargylic esters with activated benzenes, Scheme 4, step 1. These esters 2 can be either reduced or treated with metallated alkyls to give the corresponding alcohol which can then be further transformed into a leaving group (where LG is a bromide, methanesulfonate etc.) Scheme 3 step 2 for displacement with phenols to obtain the end product 5.

## Scheme 5

Method E) In Scheme 5 is a variant of the phenyl acetylenic ester strategy described in Scheme 4. This involves the direct treatment of a phenyl acetylene, 2 with methylolithium followed by quench with ethyl chloroformate to give the phenyl acetylenic ester (R. Rossi et. al Tet. Let 33, 4495, 1992). Subsequent reduction or Grignard addition step forms the phenyl propargylic alcohol, 3. Further elaboration to the end product, step 2 is the same as described in Scheme 4, step 3.

The reactions for obtaining the compounds of formula I are advantageously carried out in aprotic inert organic solvents. Such solvents are hydrocarbons such as benzene, toluene, xylene or cyclohexane, chlorinated hydrocarbons such as dichloromethane, trichloromethane, tetrachloromethane or chlorobenzene, ethers, including diethyl ether, 1,2-dimethoxyethane, diglyme, tetrahydrofuran or dioxane, nitriles such as acetonitrile or propionitrile, amides such as N,N-dimethyl formamide, diethyl formamide or N-methylpyrrolidinone. The reaction temperatures are preferably in the range from -20° to +120°C. The reactions are usually slightly exothermic and can as a rule be carried out at room temperature. The reaction mixture can be heated for a brief time to boiling point to shorten the reaction time or also to initiate the reaction. The reaction times can also be shortened by addition of a few drops of a base as reaction catalyst. Particularly suitable bases are tertiary amines such as trimethylamine, triethylamine, quinuclidine, 1,4-diazabicyclo[2.2.2]octane, 1,5-diazabicyclo[4.3.0]non-5-ene or 1,5-diazabicyclo[5.4.0]

undec-7-ene. Further suitable bases are also inorganic bases, typically hydrides such as sodium or calcium hydride, hydroxides such as sodium and potassium hydroxide, carbonates such as sodium and potassium carbonate, or hydrogencarbonates such as potassium and sodium hydrogencarbonate. The compounds of formula I can be isolated in conventional manner by concentrating the reaction mixture and/or removing the solvent by evaporation and by recrystallising or triturating the solid residue in a solvent in which it is not readily soluble, typically an ether, an aromatic hydrocarbon or a chlorinated hydrocarbon.

The compounds of formula I or compositions containing them may be used according to this invention by all standard methods of application used in agriculture, including preemergence application, postemergence application and seed dressing, as well as by different methods and techniques such as controlled release. For controlled release, a solution of the herbicide is applied to a mineral granular carrier or to a polymerised granulate (urea/formaldehyde) and then dried. A coating can then be additionally applied (coated granules) that allows the herbicide to be released at a controlled rate over a specific period of time.

The compounds of formula I may be used as herbicides in unmodified form, i.e. as obtained in the synthesis. They are preferably processed in conventional manner to emulsifiable concentrates, directly sprayable or dilutable solutions, dilute emulsions, wettable powders, soluble powders, dusts, granulates or microcapsules with the formulation assistants customarily employed in formulation technology. Such formulations are described, for example, in WO 97/34485, pages 9 to 12. As with the type of agents, the methods of application such as spraying, dusting, wetting, scattering or pouring, are selected in accordance with the intended objectives and the prevailing circumstances.

The formulations, i.e. the agents, preparations, or compositions comprising the compound of formula I or at least one compound of formula I and usually one or more than one liquid or solid formulation assistant, are prepared in known manner, e.g. by homogeneously mixing and/or grinding the herbicide with said formulation assistants, typically solvents or solid carriers. Surface-active compounds (surfactants) may additionally be used for preparing the formulations. Examples of solvents and solid carriers are described in said WO 97/34485, page 6.

Depending on the herbicide of formula I to be formulated, suitable surface-active compounds are nonionic, cationic and/or anionic surfactants and surfactant mixtures having

good emulsifying, dispersing and wetting properties. Examples of suitable anionic, nonionic, and cationic surfactants are listed in said WO 97/34485, pages 7 and 8. Also the surfactants customarily used for the art of formulation and described, *inter alia*, in "Mc Cutcheon's Detergents and Emulsifiers Annual" MC Publishing Corp., Ridgewood New Jersey, 1981, Stache, H., "Tensid-Taschenbuch" (Handbook of Surfactants), Carl Hanser Verlag, Munich/Vienna, 1981, and M. and J. Ash, "Encyclopedia of Surfactants", Vol I-III, Chemical Publishing Co., New York, 1980-81 are suitable for manufacture of the herbicides according to the invention.

The herbicidal compositions will as a rule contain from 0.1 to 99 % by weight, preferably from 0.1 to 95% by weight, of herbicide, from 1 to 99.9% by weight, preferably from 5 to 99.8 % by weight, of a solid or liquid adjuvant, and from 0 to 25% by weight, preferably from 0.1 to 25% by weight, of a surfactant. Whereas it is preferred to formulate commercial products as concentrates, the end user will normally use dilute formulations. The compositions may also contain further ingredients, such as: stabilisers, e.g. where appropriate epoxidised vegetable oils (epoxidised coconut oil, rapeseed oil, or soybean oil); antifoams, typically silicone oil; preservatives; viscosity regulators; binders; and tackifiers; as well as fertilisers or other chemical agents.

The compounds of formula I are usually applied with success to the plants or the locus thereof in rates of application of 0.001 to 4 kg/ha, preferably 0.005 to 2 kg/ha. The rate of application required to achieve the desired action can be determined by experimentation. It will depend on the type of action, the development stage of the cultivated plant and of the weed, as well as on the application (locus, time, method), and as a result of these variables can vary over a wide range.

The compounds of formula I have excellent herbicidal and growth inhibiting properties, which make them suitable for application in crops of cultivated plants, especially in cereals, cotton, soybeans, sugar beet, sugar cane, plantations, rape, maize, and rice, and for the non-selective control of weeds. Crops will also be understood as meaning those crops that have been made tolerant to herbicides or classes of herbicides by conventional breeding or genetic engineering methods. The weeds to be controlled may be monocot as well as dicot weeds, typically *Stellaria*, *Nasturtium*, *Agrostis*, *Digitaria*, *Avena*, *Setaria*, *Sinapis*, *Lolium*, *Solanum*, *Echinochloa*, *Scirpus*, *Monochoria*, *Sagittaria*, *Bromus*, *Alopecurus*, *Sorghum halepense*, *Rottboellia*, *Cyperus*, *Abutilon*, *Sida*, *Xanthium*, *Amaranthus*, *Chenopodium*, *Ipomoea*, *Chrysanthemum*, *Galium*, *Viola*, and *Veronica*.

The invention is illustrated by the following non-limitative Examples.

Preparative Examples:

**Example 1:**

**Preparation of:**

**3-(2,6-dimethoxyphenoxy)-1-(3-phenylacetonitrile) propyne (1)**

---

**Step 1 Preparation of:**

**2,6-dimethoxy-O-propargyl phenol ether (1a)**

2,6-dimethoxyphenol (2.59 g) and potassium carbonate (2.30 g) are suspended in acetone (95 ml). Then propargyl bromide ( 5.00 g) is added dropwise with stirring at reflux temperature (56 °C) followed by stirring for 2.5 hours. The reaction is monitored by TLC (thin-layer chromatography, 10% ethyl acetate/n-hexane as eluant) on silica gel. The brown

yellow mixture after reaction completion is filtered and then concentrated to an oil which is then chromatographed on silica gel with ethyl acetate/n-hexane elution (1:9). Evaporation of solvent gives the product (3.25 g, 99%) as a pure yellow oil. NMR (CDCl<sub>3</sub>): 7.08-6.55 (m, 3H); 4.70 (d, 2H); 3.82 (s, 6H), 2.45 (t, 1H).

**Step 2 Preparation of:**

**3-(2,6-dimethoxyphenoxy)-1-(3-phenylacetonitrile) propyne (1)**

A catalyst mixture consisting of palladium tetrakis triphenylphosphine (116 mg), copper (I) iodide (15 mg) is dissolved in piperidine followed by addition of a solution of 2,6-dimethoxy-O-propargyl phenol ether (1) (420 mg) in piperidine (2 ml) at room temperature under nitrogen atmosphere. After stirring 10 minutes a solution of 3-iodo-1-phenylacetonitrile (505 mg) in piperidine (2 ml) is added. An immediate exothermic reaction (40 °C) is observed with subsequent cooling to room temperature accompanied by the formation of a thick suspension. Stirring is continued for 2-3 hours while the reaction is monitored by TLC (20% ethyl acetate/n-hexane) on silica gel. Then a saturated solution of ammonium chloride (40 ml) is added and subsequently extracted with diethyl ether (2 x 40 ml) followed by drying the organic phase over sodium sulfate. Evaporation of the filtered solution gives a dark brown residue which is triturated with diethylether to give a precipitate which is removed by filtration. The filtrate was then evaporated and the resulting oil is chromatographed on silica gel with n-hexane/ethyl acetate elution (9:1). Evaporation and drying under high vacuum gives the desired product as a pure product (304 mg, 49% yield) in the form of a brown resin. NMR (CDCl<sub>3</sub>): 7.20-7.38 (m, 4H), 7.00 (t, 1H), 6.58 (d, 2H); 4.90 (s, 2H); 3.87 (s, 6H); 3.70 (s, 2H).

### Example 2:

**Preparation of:**

**3-(2-trifluoromethoxyphenoxy)-1-(3-phenylacetonitrile) propyne (2)**

### Step 1 Prepration of:

### 3-(2-trifluoromethoxy)-O-propargyl phenol ether (2a)

3-trifluoromethoxy phenol (2.99 g) and potassium carbonate (2.30 g) are suspended in acetone (95 mL). Then propargyl bromide (5.00 g) is added dropwise with stirring at reflux temperature (56 °C) followed by stirring for 2.5 hours. The reaction is monitored by TLC (10% ethyl acetate/n-hexane) on silica gel. The cooled mixture after reaction completion is filtered and then concentrated to an oil which is then chromatographed on silica gel with ethyl acetate/n-hexane elution (1:9). Evaporation of solvent gives the product (2.65 g, 73%) as a pure yellow oil. NMR (CDCl<sub>3</sub>): 7.30-6.91 (m, 4H), 4.75 (d, 2H), 2.51 (t, 1H).

### Step 2 Preparation of:

**3-(2-trifluoromethoxyphenoxy)-1-(3-phenylacetonitrile) propyne (2)**

- 18 -

A catalyst mixture consisting of palladium tetrakis triphenylphosphine (118 mg), copper (I) iodide (15 mg) is added to a solution of 3-iodo-1-phenylacetonitrile (500 mg) in piperidine (3 ml) at room temperature under nitrogen atmosphere. After stirring 30 minutes a solution of 3-(2-trifluoromethoxy)-O-propargyl phenol ether (2a) (444 mg) in piperidine (2 ml) is added. An immediate exothermic reaction (35 °C ) is observed with subsequent cooling to room temperature. Stirring is continued for 4 hours while the reaction is monitored by TLC (20% ethyl acetate/n-hexane) on silica gel. Then a saturated solution of ammonium chloride (40 ml) is added and subsequently extracted with ethyl acetate (2 x 20 ml) followed by drying the organic phase over sodium sulfate. Evaporation of the filtered solution gives a dark brown resin which is triturated with diethylether to give a precipitate which is removed by filtration. The filtrate was then evaporated and the resulting oil is chromatographed on silica gel with n-hexane/ethyl acetate (9:1) elution. Evaporation and drying under high vacuum gave the desired product as a pure product (430 mg, 63% yield) in the form of a yellow oil. NMR (CDCl<sub>3</sub>): 7.40-6.90 (m, 8H), 6.74 (d, 1H), 6.60 (d, 1H); 5.00 (s, 2H); 3.72 (s, 2H).

**Preparation of: 3-iodo-1-alpha bromo toluene (2b)**

3-iodo-toluene (65.4 g), N-bromosuccinimide (53.4 g) was dissolved in carbon tetrachloride (200 ml) and heated to reflux temperature under irradiation with 120W tungsten lamp. Then azoisobutyronitrile (100 mg) and dibenzoyl peroxide (100 mg) was added with continued stirring at reflux overnight (12 hours). Although the mixture still showed some trace amounts of starting material by TLC (20% ethyl acetate/n-hexane), the cooled reaction mixture was worked up. The filtered reaction solution was successively washed with water,

aqueous sodium bicarbonate and brine and then dried over sodium sulfate. Filtration and evaporation gave an oil which was purified by silica gel chromatography with ethyl acetate/n-hexane elution. The yield was 65.2 g, 73% yield. NMR ( $\text{CDCl}_3$ ): 7.91-7.00 (m, 3H), 6.50 (s, 1H), 4.40 (s, 2H).

**Preparation of 3-iodo-1-phenylacetonitrile (2c)**

The foregoing product (2b) (65.2 g) was dissolved in toluene (238 ml) containing sodium cyanide (11.8 g), tetra-n-butyl benzylammonium bromide (1.0 g) and water (20 ml). The solution was warmed to 50 °C and stirred vigorously for 12 hours. TLC monitor (20 % ethyl acetate/n-hexane) showed the reaction still incomplete and sodium cyanide (5.0 g) and water (20 ml) was added with continued stirring. After an additional 6 hours the reaction was worked up by washing in water and subsequently drying over sodium sulfate. Filtration and evaporation gave a crude oil which was purified by silica gel column chromatography to give 30.6 g, 57% yield. NMR ( $\text{CDCl}_3$ ): 7.65-7.20 (m, 3H), 7.10 (s, 1H), 3.70 (s, 2H).

**Example 3:**

**Preparation of:**

**3-(2-methoxyphenoxy)-1-(2-chloro-4-aminophenyl) propyne (3)**

---

**Step 1 Preparation of: 3-(2-methoxy)-O-propargyl phenol ether (3a)**

2-Methoxy phenol (4.17 g) and potassium carbonate (4.64 g) are suspended in acetone (95 ml). Then propargyl bromide (10.00 g) is added dropwise with stirring at reflux temperature (56 °C) followed by stirring for 2.5 hours. The reaction was regularly monitored by TLC (10% ethyl acetate/n-hexane). The cooled mixture after reaction completion is filtered and then concentrated to an oil which is then chromatographed on silica gel with ethyl acetate/n-hexane elution (1:9). Evaporation of solvent gives the product (2.65 g, 89%) as a oil. NMR (CDCl<sub>3</sub>): 6.70-7.05 (m, 4H); 4.75 (d, 2H); 4.65 (t, 1H); 3.85 (s, 3H), 2.50 (t, 1H).

**Step 2 Preparation of:****3-(2-methoxyphenoxy)-1-(2-chloro-4-aminophenyl) propyne (3)**

A catalyst mixture consisting of palladium tetrakis triphenylphosphine (116 mg), copper (I) iodide (15 mg) is added to a solution of 3,5-dichloro-1-iodobenzene (506 mg) in piperidine (2 ml) at room temperature under nitrogen atmosphere. After stirring 10 minutes a solution of 3-(2-methoxy)-O-propargyl phenol ether (3a) (324 mg) in piperidine (2 ml) is added. An immediate exothermic reaction (40 °C) is observed with subsequent cooling to room temperature accompanied by the formation of a thick suspension. Stirring is continued for 2-3 hours while the reaction is monitored by TLC (20% ethyl acetate/n-hexane) on silica gel. Then a saturated solution of ammonium chloride (40 ml) is added and subsequently extracted with diethyl ether (2 x 40 ml) followed by drying the organic phase over sodium sulfate. Evaporation of the filtered solution gives a dark brown resin which is triturated with diethylether to give a precipitate which is removed by filtration. The filtrate was then evaporated and the resulting oil is chromatographed on silica gel with n-hexane/ethyl

acetate elution. Evaporation and drying under high vacuum gives the desired product as a pure product (232 mg, 40% yield) in the form of a yellow oil. NMR ( DMSO ):7,2 (s, 1H ), 6,8-7,08 (m , 5H ), 6,65-6,71 (d , 1H); 6,75 (NH) ( s , 2H), 4,90 (s , 2H); 3,7 (s , 3H); 6.80-7.71 (m, 6H); 5.05 (s, 2H); 2.49 (s, 2H).

The following compounds are prepared in a manner analog to the above described.

### Biological Examples

#### Example B1: Pre-emergence herbicidal action

Monocot and dicot test plants are sown in standard soil in plastic pots. Immediately after sowing, the test substances are sprayed on as an aqueous suspension [prepared from a wettable powder (Example F3, b) of WO 97/34485)] or as an emulsion [prepared from an emulsion concentrate (Example F1 c) of WO 97/34485)] in an optimal dosage (500 l of water/ha). The test plants are then cultivated in the greenhouse under optimum conditions.

The test is evaluated 4 weeks later on a rating scale of 1-9 (1 = total damage, 9 = no action). Ratings of 1 to 4 (especially 1 to 3) denote good to very good herbicidal action.

**Table biology 1:** Preemergence test at 1kg/ha:

Compound	Setaria	Panicum	Digitaria	Amaranthus	Chenopodium	Stellaria	Veronica
1.104	4	7	7	1	1	1	1
1.098	1	1	3	1	1	1	1

1.168	4	1	3	1	2	1	4
1.033	2	2	1	1	1	1	1

Similar results are obtained by formulating the compounds of formula I in accordance with the other examples of WO 97/34485.

#### Example B2: Post-emergence herbicidal action

Monocot and dicot test plants are sown in standard soil in plastic pots. At the 2- to 3-leaf stage, the test plants are sprayed with test substances as an aqueous suspension [prepared from a wettable powder (Example F3, b) of WO 97/34485)] or as an emulsion [prepared from an emulsion concentrate (Example F1 c) of WO 97/34485)] in an optimal dosage (500 l of water/ha). The test plants are then cultivated in the greenhouse under optimum conditions.

The test is evaluated 2 to 3 weeks later on a rating scale of 1-9 (1 = total damage, 9 = no action). Ratings of 1 to 4 (especially 1 to 3) denote good to very good herbicidal action.

**Table biology 2:** Postemergence test at 1kg/ha:
